

Understand Myself

Personality Assessment Report

Prepared for **Fernando Costa Neto**

The Understand Myself personality assessment and report is based on the Big Five Aspects Scale, the scientific model that describes your personality through the (Big Five) factors and each of their two aspects. This report describes where you stand in comparison to others in the general population on these traits and aspects.

The traits and aspects of the Big Five personality model are:

- Agreeableness: Compassion and Politeness
- Conscientiousness: Industriousness and Orderliness
- Extraversion: Enthusiasm and Assertiveness
- Neuroticism: Withdrawal and Volatility
- Openness: Intellect and Aesthetics

In the original Big Five Aspects Scale model, the openness factor was entitled "Openness to Experience," and its aspects were called "Intellect" and "Openness". For the sake of clarity, we have deviated from this, and use "Openness" or "Openness to Experience" to refer to the factor level trait and "Intellect" and "Aesthetics" to refer to its aspects.

Our systems have compared your-self-ratings to those of thousands of other people. You are being compared to men and women of all ages. This means that if you are young, your scores on neuroticism will be higher and on agreeableness and conscientiousness will be lower than if you were compared to people of your own age (with the reverse being true for older individuals). For men, their scores on agreeableness and on neuroticism will be lower than if they were just being compared to men. We decided to make the comparisons simple, so that you know where you stand in comparison to the typical person (with age and sex regarded as irrelevant).

Your scores are presented as percentiles. A percentile indicates where you stand on a particular trait with respect to the population. A percentile score of, say, 63, indicates that your score is as high or higher than 63% of the population.

Remember that each personality trait and aspect (and your relative position with respect to them) has advantages and disadvantages. It is for that reason that variation exists in the human population: there is a niche for each personality configuration. Much of what constitutes success in life is therefore the consequence of finding the place in relationships, work and personal commitment that corresponds to your unique personality structure. Good luck with your expanded self-understanding!

Note also that if you find the descriptions harsher than you might consider appropriate this may mean that you were more self-critical than necessary when completing the questions (remember, the results are based on your own self-report, compared to that of others). This can occur if you were feeling temporarily or chronically unhappy or anxious, or hungry, angry or judgmental when you completed the questions.

Agreeableness: Moderately Low

You are moderately low in agreeableness, which is the primary dimension of interpersonal interaction in the Big Five personality trait scientific model. The two aspects of agreeableness are compassion and politeness.

Your score puts you at the **26th** percentile for agreeableness. If you were one of 100 people in a room, you would be lower in agreeableness than **73** of them and higher in agreeableness than **26** of them.

Agreeableness is a very complex trait, with marked positive and negative elements all along its distribution. Because of this, higher scores and lower scores need to be explained at the same time. People high in agreeableness are nice: compliant, nurturing, kind, naively trusting and conciliatory. However, because of their tendency to avoid conflict, they often dissemble and hide what they think.

People low in agreeableness are not so nice: stubborn, dominant, harsh, skeptical, competitive and, in the extreme, even predatory. However, they tend to be straightforward, even blunt, so you know where they stand.

People with moderately low levels of agreeableness are seen by others as somewhat competitive, colder and less empathic. They are less likely to look for the best in others, and are not particularly tolerant (an attitude that is much valued by agreeable people). They are less concerned about the emotional state of others, willing to engage in conflict, and will sacrifice peace and harmony to make a point or (if conscientious) to get things done. People find them straightforward, even blunt. They tend towards dominance, rather than submission (particularly if also below average in neuroticism).

People with moderately low levels of agreeableness are not particularly forgiving, accepting, flexible, gentle or patient. They don't easily feel pity for those who are excluded, punished or defeated. They are also not easily taken advantage of by disagreeable, manipulative or otherwise troublesome people, or by those with criminal or predatory intent. Their skepticism plays a protective role, although it may interfere with their ability to cooperate with or trust others whose intentions are genuinely good. They can appreciate cooperation, but like competition, with its clear losers and winners. They will not easily lose arguments (or avoid discussions) with less agreeable people. They tend to be good at bargaining for themselves, or at negotiating for more recognition or power. They are likely to have higher salaries and to earn more money, in consequence. They are therefore less likely to suffer from resentment or to harbour invisible anger, although this tendency may be increased, if they are very high in neuroticism. In addition, because of their tendency to engage in conflict, when necessary, moderately disagreeable people tend not to sacrifice medium- to long-term stability and function for the sake of short-term peace. This means that problems that should be solved in the present are often solved, and do not accumulate counterproductively across time.

Women are higher in agreeableness than men. The mean percentile for women in a general population (women and men) is 61.5. For men it is 38.5. The fact that men are lower in agreeableness than women helps explain their much higher rates of criminal incarceration (90% male). The primary difference between criminals and non-criminals is disagreeableness. If the typical criminal is more disagreeable than 98% of people in the general population, then almost all those criminals will be male. This difference in agreeableness between men and women is largest in countries such as Norway and Sweden, where the most has been done to ensure equality of outcome between the sexes. This provides strong evidence that biological factors rather than environment and learning account for the dissimilarity.

Agreeableness, per se, is not strongly associated with political liberalism or conservatism, but this is because the aspects of agreeableness predict such political belief in opposite ways, and cancel each other out. Liberals are higher in aspect compassion, and conservatives in aspect politeness. However, alliance with the category of belief that has come to be known as politically correct is strongly predicted by agreeableness (particularly compassion). What this appears to mean is that agreeable people strongly identify with those they deem oppressed, seeing them, essentially, as exploited infants, and demonize those they see as oppressors, seeing them as cruel, heartless predators.

There are large differences between men and women in terms of spontaneous interest, and these also appear associated with agreeableness. Agreeable people, caring as they do for others, are more likely to enter professions associated with people, such as teaching and nursing, which are dominated by women. This is true even in the Scandinavian countries, where attempts to produce gender-equal societies has reached a maximum.

Disagreeable people, by contrast, appear to prefer systematizing over empathizing, and are more interested in things – machines and technology. In consequence, professions such as engineering and trades associated with construction and machinery tend to be dominated by relatively disagreeable men.

Compassion: Low

You are low in compassion. Compassion is an aspect of agreeableness. The other aspect of agreeableness is politeness.

Your score puts you at the **16th** percentile for compassion. If you were one of 100 people in a room, you would be lower in compassion than **83** of them and higher in compassion than **16** of them.

Much less compassionate people are not primarily oriented towards the problems of other people or other living things. They are less swayed by cuteness. They are willing to make other people experience negative emotion by engaging in conflict and competition. They like to win, and will engage in confrontation to do so.

They are substantially less concerned about helping other people. They make sure their own needs and interests are attended to, and are less willing to sacrifice for the sake of other people. This can make them harsh and unsympathetic. People might turn to them for the cold, hard truth, but not for a soft, patient, eternally-listening ear. They are less empathetic and caring. However, because they are not primarily other-oriented, they can often negotiate very effectively on their own behalf, and are likely to get at least what they deserve (for their hard work, for example). In consequence, they are unlikely to harbor feelings of resentment or hidden anger.

Those who are liberal, politically, score somewhat higher in compassion than conservatives.

Women are also higher in compassion than men. The mean percentile for women in a general population (women and men) is 61. For men it is 39.

Politeness: Typical or Average

You are typical or average in politeness. Politeness is an aspect of agreeableness. The other aspect of agreeableness is compassion.

Your score puts you at the **45th** percentile for politeness. If you were one of 100 people in a room, you would be higher in politeness than **45** of them and lower in politeness than **54** of them.

Typically polite people can be deferential to authority, but can also be challenging, when necessary. They are not particularly obedient. They can be respectful, but will also push back if pushed. They are not made uncomfortable by the necessity of standing up to other people. Typically polite people will avoid conflict, reasonably, but are not completely averse to confrontation.

Those who are liberal, politically, score somewhat lower in politeness than conservatives (the opposite pattern is seen with compassion).

Women are higher in politeness than men. The mean percentile for women in a general population (women and men) is 59. For men it is 41.

Conscientiousness: Moderately High

You are moderately high in conscientiousness, which is the primary dimension of dutiful achievement in the Big Five personality trait scientific model.

Your score puts you at the **63rd** percentile for conscientiousness. If you were one of 100 people in a room, you would be higher in conscientiousness than **63** of them and lower in conscientiousness than **36** of them.

Conscientiousness is a measure of obligation, attention to detail, hard work, persistence, cleanliness, efficiency and adherence to rules, standards and processes. Conscientious people implement their plans and establish and maintain order. The two aspects of conscientiousness are industriousness and orderliness.

Moderately conscientious people are dutiful. They tend to slog away at a task until finished. They work reasonably hard and do not want to waste time. They are less likely than average to procrastinate (particularly if they are also low in neuroticism). If a moderately conscientious person promises to do something, they will do it, and rarely be delayed. They tend to be relatively decisive, neat, organized, future-oriented, and reliable. They are not too-frequently distracted.

Moderately conscientious people are more likely than average to obtain higher grades in academic settings (particularly if they are also intelligent), and to make competent administrators and managers. They like to have everything in its proper place, but are not particularly obsessed with detail. They tend to do things by the book. Moderately conscientious people are somewhat prone to guilt (although they organize their lives so that they have comparatively little to feel guilty about). They are also more sensitive than average to shame, self-disgust and self-contempt.

Individuals who are moderately conscientious react comparatively poorly to failure (particularly if they are above average in neuroticism). They tend to be judgemental and can be disgusted by their own moral transgressions, as well as those of others. They suffer higher than normal levels of shame and guilt when unemployed or otherwise unoccupied, even when that occurs through no fault of their own. Moderately conscientious people are committed to the idea of personal responsibility. They believe that hard work and diligence will and should be rewarded, and tend to think that those who don't succeed deserve their failure. They value hygiene, moral purity and achievement. Now and then they might micro-manage and exert too much control.

Moderately conscientious people are slightly more likely to be political conservatives, rather than liberal (particularly if they are also below average in openness).

Women are very slightly more conscientious than men. The mean percentile for women in a general population (women and men) is 51.5. For men it is 49.5.

Industriousness: High

You are high in industriousness. Industriousness is an aspect of conscientiousness. The other aspect of conscientiousness is orderliness.

Your score puts you at the **85th** percentile for industriousness. If you were one of 100 people in a room, you would be higher in industriousness than **85** of them and lower in industriousness than **14** of them.

Highly industrious people are likely to be successful in school and in administrative and managerial positions (particularly if they are intelligent). They value work highly and typically want to be doing something useful. They are dutiful, and tend not to put things off. They do not often mess things up.

They always finish what they start, and they do it on schedule. They are frequently figuring out how to accomplish more in less time, with fewer resources. They have focus.

Highly industrious people are also likely to judge shirkers or people who are incompetent quite harshly, and to want them out of the way. They are likely to believe that people fail because they don't apply themselves or work hard enough. They feel guilty, rapidly, if they do not do their duty. However, because they typically stay on or ahead of schedule and accept their responsibilities, they rarely experience actual guilt.

Those who are liberal and those who are conservative appear equally industrious.

Men are slightly more industrious than women. The mean percentile for men in a general population (women and men) is 51.5. For women it is 49.5.

Orderliness: Moderately Low

You are moderately low in orderliness. Orderliness is an aspect of conscientiousness. The other aspect of conscientiousness is industriousness.

Your score puts you at the **30th** percentile for orderliness. If you were one of 100 people in a room, you would be lower in orderliness than **69** of them and higher in orderliness than **30** of them.

People moderately low in orderliness are neither disturbed nor disgusted by mess and chaos. They tend simply not to notice such things. They see the world in shades of grey, rather than black and white, and are non-judgmental in their attitudes toward themselves and others.

They rarely use schedules, list, or routines and, even if they plan, tend not to implement those plans, preferring to take things as they come, and let chance determine the outcome. They are not oriented toward detail and take neither rules nor procedures too seriously.

People who are moderately low in orderliness care less than average for routine and predictability. Their schedules are loose and disruption doesn't bother them. They require almost constant reminder and supervision to maintain attention and focus, and are easily distracted. They can, however, tolerate the mess, disruption and intervening periods of chaos that may accompany creative endeavour.

Those who are below average in orderliness are less likely to be political conservatives. Orderliness is the second-best predictor of conservatism, after openness.

Women are more orderly than men. The mean percentile for women in a general population (women and men) is 54.5. For men it is 45.5. This may account for some of the trouble in relation to housework between women and men. Since women are, on average, more orderly, household disorder will trigger disgust and discomfort in them faster. This may happen with sufficient frequency so they end up doing a disproportionate share of such work (even though if they waited a bit longer their less orderly partners, often men, might end up equally troubled and motivated to fix the problem). Orderly people are more likely to have items such as event calendars, drawer organizers, laundry baskets, irons and ironing boards in their immediate environments.

Extraversion: Typical or Average

You are typical or average in extraversion, which is the primary dimension of positive emotion in the Big Five personality trait scientific model. Extraversion is a measure of general sensitivity to positive emotions such as hope, joy, anticipation and approach, particularly in social situations. The two aspects of extraversion are enthusiasm and assertiveness.

Your score puts you at the **53rd** percentile for extraversion. If you were one of 100 people in a room, you would be higher in extraversion than **53** of them and lower in extraversion than **46** of them.

Since extraversion and introversion are poles that denote the ends of the spectrum for this trait, you can also think of yourself as being average in introversion.

People with average levels of extraversion are not overly enthusiastic, talkative, assertive in social situations, or gregarious. They enjoy social contact, but are also happy spending time alone. They will plan parties occasionally, and make people laugh, but are often willing to let others take the lead in organizing social situations and entertaining. They have a balanced view of the past and the future, neither over-emphasizing nor dismissing the positive.

People with average levels of extraversion strike a good balance between privacy and self-disclosure. They can keep quiet, when necessary, and are unlikely to blurt out information that might be better kept to themselves. They will express their viewpoint in meetings, but are typically not the first to do so. They are not generally known as talkative. At times, they can be captivating and convincing, but are not so on a habitual basis. They are not often the first to act in ambiguous situations.

People with average levels of extraversion can fit well into a range of jobs. They are sociable enough to engage in jobs involving sales, persuasion, working in groups and public speaking (particularly if they are low in neuroticism), although they may sometimes find the continual public exposure fatiguing. However, they can also adapt themselves to occupations that require a lot of isolated work (such as computer programming or accounting), as long as they also take time for socializing.

People with average levels of extraversion are not particularly impulsive, even when the opportunity to have fun in social situations beckons. They strike a balance between seeking fulfilment in the present and paying attention to the possibilities of the future. They don't find it difficult to be alone to study or work. They are less distracted than the very extraverted by opportunities to chat, joke and socialize, unless they are very low in conscientiousness. When individuals are extraverted and conscientious, they are more productive than if they are introverted and conscientious. However, when they are introverted and unconscientious, they are more productive than they are when they are extroverted and unconscientious.

People of average extraversion do not tend to dominate social situations, unless they are very low in agreeableness. Less agreeable extraverts tend to be self-centered – something that can be made worse if they are also low in conscientiousness.

Those who are politically liberal are slightly less extraverted than conservatives.

Women are slightly more extraverted than men. The mean percentile for women in a general population (women and men) is 52. For men it is 48.

Enthusiasm: Moderately Low

You are moderately low in enthusiasm. Enthusiasm is an aspect of extraversion. The other aspect of extraversion is assertiveness.

Your score puts you at the **30th** percentile for enthusiasm. If you were one of 100 people in a room, you would be lower in enthusiasm than **69** of them and higher in enthusiasm than **30** of them.

Individuals who are moderately low in enthusiasm are rarely excitable, not particularly easy to get to know, and not known for their talkative nature. When they do talk, it tends only to be about things in which they find particular interest.

They do not easily open up to people, particularly in larger social gatherings or parties. They laugh more rarely than others. They tend to prefer solitude, although they can enjoy themselves around other people, in moderation. They are more private people, and are not particularly positive or optimistic. They do not crave the spotlight and, if creative, may find performing less desirable. They rarely seek out stimulation, excitement, activity or fun (and, if they do so, prefer quieter activities). People moderately low in enthusiasm are not gregarious or people-loving, and are not particularly positive about what might happen next .

Enthusiasm is not strongly associated with political preference, either conservative or liberal.

Women are higher in enthusiasm than men. The mean percentile for women in a general population (women and men) is 55. For men it is 45.

Assertiveness: Moderately High

You are moderately high in assertiveness. Assertiveness is an aspect of extraversion. The other aspect of extraversion is enthusiasm.

Your score puts you at the **73rd** percentile for assertiveness. If you were one of 100 people in a room, you would be higher in assertiveness than **73** of them and lower in assertiveness than **26** of them.

Moderately assertive people are more “take charge” types. They put their own opinions forward, and are somewhat likely to dominate and control social situations. They can be influential and captivating. They have the communication style that is more often associated with leadership.

This is good when they are knowledgeable, competent and able, but less good when they aren't. Moderately assertive people tend to be more action-oriented. They are less likely to wait for others to lead the way. Now and then they might be impulsive, in consequence, acting too quickly, without thinking.

Liberals tend to be slightly less assertive than conservatives.

Women are slightly less assertive than men. The mean percentile for women in a general population (women and men) is 48. For men it is 52.

Neuroticism: Moderately Low

You are moderately low in neuroticism, which is the primary dimension of negative emotion in the Big Five personality trait scientific model. Neuroticism is a measure of general sensitivity to negative emotions such as pain, sadness, irritable or defensive anger, fear and anxiety. The two aspects of neuroticism are withdrawal and volatility.

Your score puts you at the **26th** percentile for neuroticism. If you were one of 100 people in a room, you would be lower in neuroticism than **73** of them and higher in neuroticism than **26** of them.

People with moderately low levels of neuroticism tend not to focus on the negative elements, anxieties and uncertainties of the past, present and future.

They can have periods of time where they are unhappy, anxious and irritable, particularly when facing a serious, sustained problem, but they generally cope well, don't worry too much, and recover comparatively quickly when stressed. They're pretty good at keeping their head in a storm, and they tend not to make mountains out of molehills.

They tend to have higher than average levels of self-esteem, particularly when they are also average or above average in extraversion. They are at relatively low risk for developing anxiety disorders and depression (again, particularly if average or above in extraversion).

When good things happen to them, people with moderately low levels of neuroticism can accept it, without wondering if they deserved it. They generally tend to be satisfied with their relationships and careers. Overall, they are quite tolerant of stress, and can accept failure and setbacks as part of life. Moderately low levels of neuroticism are associated with less concern about mental and physical health, fewer physician and emergency room visits, and a lower than average degree of absenteeism at work and at school (unless accompanied by very low levels of conscientiousness).

People with moderately low levels of neuroticism can handle risk better without becoming unduly concerned. They are less concerned with security, and can handle recreational, career, financial and social situations where the possibility of loss is higher. This makes it easier for them to consider as well as implement career changes and other transformations that could enhance their lives.

Neuroticism is not a powerful predictor of political belief, either conservative or liberal.

Females tend to be higher in neuroticism than males. The typical woman is higher in neuroticism than 60% of the general population of men and women combined. In part, this may be why women report more unhappiness in their relationships, at work, in school and with their health than men, on average, and why women initiate 70% of all divorces. This difference in neuroticism between men and women appears to emerge at puberty. It is largest in countries such as Norway and Sweden, where the most has been done to ensure equality of outcome between the sexes. This provides strong evidence that biological factors rather than environment and learning account for the dissimilarity.

Withdrawal: Low

You are low in withdrawal. Withdrawal is an aspect of neuroticism. The other aspect of neuroticism is volatility.

Your score puts you at the **19th** percentile for withdrawal. If you were one of 100 people in a room, you would be lower in withdrawal than **80** of them and higher in withdrawal than **19** of them.

Individuals low in withdrawal rarely suffer from or are impeded by anticipatory anxiety. They can handle new, uncertain, unexpected, threatening or complex situations well. They are substantially less likely to avoid or withdraw in the face of the unknown and unexpected.

People with low levels of withdrawal tend not to feel sad, lonesome, disappointed and grief-stricken – and, if they do, not deeply nor for long. They experience much lower than normal levels of doubt and worry, embarrassment, self-consciousness and discouragement in the face of threat and punishment. They are quite resistant to and rarely worried about social rejection, and rarely feel hurt or threatened. Even when actually hurt, frightened, or anxious, they recover easily and quickly. People with low levels of withdrawal are not worriers. Technically, withdrawal has been associated with activity in the brain systems that regulate passive avoidance.

Those who are liberal, politically, are slightly higher in withdrawal than conservatives.

Women are higher in withdrawal than men. The mean percentile for women in a general population (women and men) is 60. For men it is 40.

Volatility: Moderately Low

You are moderately low in volatility. Volatility is an aspect of neuroticism. The other aspect of neuroticism is withdrawal.

Your score puts you at the **38th** percentile for volatility. If you were one of 100 people in a room, you would be lower in volatility than **61** of them and higher in volatility than **38** of them.

Individuals moderately low in volatility tend not to vary much in their mood. They are not particularly irritable, and feel lower levels of disappointment, frustration, pain and social isolation. People find them easy to be around.

They express their frustration, disappointment and irritability quite reasonably and not very often. Even when stirred up and upset or angry or irritated, they calm down quickly. They are less argumentative than average and rarely lose their composure.

If overly provoked in a dispute, a person that is moderately low in volatility may react in kind (particularly if also low in agreeableness). However, such people tend to remain calm and unperturbed, even when stressed.

Volatile people tend to get upset if something bad does happen, while people high in withdrawal (the other aspect of neuroticism) tend to be concerned that something bad might happen. Technically, volatility has been associated with activity in the brain systems that regulate fight, flight or freeze.

Volatility is not strongly related to political preference, either liberal or conservative.

Women are higher in volatility than men. The mean percentile for women in a general population (women and men) is 57.5. For men it is 42.5.

Openness: Typical or Average

You are typical or average in openness, which is the primary dimension of creativity, artistic interest and intelligence (particularly verbal intelligence) in the Big Five personality trait scientific model. Openness is a measure of interest in novelty, art, literature, abstract thinking, philosophy as well as sensitivity to aesthetic emotions and beauty. The two aspects of openness are intellect and aesthetics.

Your score puts you at the **45th** percentile for openness. If you were one of 100 people in a room, you would be higher in openness than **45** of them and lower in openness than **54** of them.

People with typical levels of openness are as smart and creative as others, on average. They are not generally characterized as exploratory or visionary,

but have their moments of insight and realization. They are sometimes interested in learning for its own sake and show some interest in acquiring new abilities and skills. They are not overwhelmingly curious, and are not strikingly interested in abstract thinking, philosophy, or the meaning of belief systems and ideologies. They will attend cultural events such as movies, concerts, dance recitals, plays, poetry readings, gallery openings and art shows, but do not find themselves compelled to do so. They sometimes enjoy writing and will occasionally enjoy encountering and trying to solve a complex problem, or explore abstract ideas.

They tend to read an average amount – but more mainstream material. They have a normal range of interests, and a reasonable vocabulary. They can think and learn reasonably quickly. They sometimes find themselves formulating new ideas, and are articulate enough to get their thoughts across (particularly if average or above in extraversion). People average in openness now and then see old things in new ways, but are also satisfied with the tried-and-true. They can solve day-to-day problems well, and sometimes seek out a more difficult challenge.

People who are average or typical in openness can adapt reasonably well to situations or occupations that are routinized and predictable. They have little trouble fitting in at the bottom of hierarchies. They can be better suited than those who are more open to entry-level, repetitive, rote positions, because they aren't compelled to think up new ways to do things. They are not uncreative thinkers, but are less commonly known as creative or revolutionary. They rarely shake things up, particularly if they are also agreeable and less assertive.

Individuals average in openness may be entrepreneurial in spirit, but they also appreciate conventional employment. They have no more than average interest in creating new ventures, whether for profit, curiosity, or personal transformation. At least moderately high levels of openness appear necessary to the formation and leadership of business and other forms of complex organization, although conscientiousness appears required for the attention to detail and process management that such organizations also always need.

People typical in openness have an average range of interests. This makes it relatively easy for them to settle on a single path in life, to specialize to a necessary degree, and to create an integrated identity (unless they are very high or above in neuroticism and/or very low or below in conscientiousness). People characterized by the combination of moderately high openness and very high or above levels of neuroticism can undermine their own convictions and beliefs by questioning and making themselves lost and anxious. Open, unconscientious people tend to be “under-achievers” (particularly if also above average in neuroticism). Such people appear to have the capability to succeed, can learn quickly, and are creative, but they can have some trouble implementing their ideas.

Openness is the dimension that best predicts political allegiance (with conscientiousness, particularly the aspect of orderliness, coming in at second place). Those who are liberal, politically, are very much more likely to be high in openness than conservatives.

Women and men differ very little in openness at the trait level, although there are differences in the aspect levels.

Intellect: High

You are high in intellect. Intellect is an aspect of openness. The other aspect of openness is aesthetics.

Your score puts you at the **78th** percentile for intellect. If you were one of 100 people in a room, you would be higher in intellect than **78** of them and lower in intellect than **21** of them.

Note: Do not confuse the personality aspect of Intellect with IQ. Intellect is a measure of interest in abstract ideas, essentially, while IQ is a measure of processing speed, verbal ability, working memory, and problem solving capacity, and is better measured with a formal IQ test. It is perfectly possible to have a high IQ and a low score on the personality trait of Intellect.

People high in intellect are quite interested in ideas and abstract concepts. They enjoy being confronted with novel information, even when it is complex. They are substantially more curious and exploratory than average, and frequently like to tackle and solve problems. They will actively engage in and seek out and initiate issue-oriented discussions, and are likely to read, think about and want to discuss idea-centered books (most frequently non-fiction). They are generally articulate and can formulate ideas clearly and quickly (particularly if average or higher in extraversion). They have a wide vocabulary, and actively enjoy learning new things. People high in intellect will often find and generate novel, creative concepts and voluntarily search for and adapt well to new experiences and situations.

People high in intellect find complex, rapidly changing occupations to their liking and will generally do well at them (particularly if they are also high in conscientiousness and low in neuroticism). However, they are substantially less well-suited to stable, straightforward and more traditional occupations, where the rules don't change, and will experience frequent periods of boredom and frustration in such positions.

Liberals are higher in intellect than conservatives (although the biggest difference between the two is openness at the trait level).

Women are lower than men in intellect (although not in IQ). This is probably a difference in interest: people high in intellect, compared to aesthetics, are more likely to prefer the sciences to the arts. The mean percentile for women in a general population (women and men) is 45. For men it is 55.

Aesthetics: Low

You are low in aesthetics. Aesthetics is an aspect of openness. The other aspect of openness is intellect.

Your score puts you at the **17th** percentile for aesthetics. If you were one of 100 people in a room, you would be lower in aesthetics than **82** of them and higher in aesthetics than **17** of them.

In the original Big Five Aspects Scale model, the openness factor was entitled "Openness to Experience," and its aspects were called "Intellect" and "Openness". For the sake of clarity, we have deviated from this, and use "Openness" or "Openness to Experience" to refer to the factor level trait and "Intellect" and "Aesthetics" to refer to its aspects.

Generally speaking, a person's aesthetics score reflects their creativity. People who are low in aesthetics do not find beauty important and may not even notice it. They don't generally require or request an outlet for their creative ability, and will certainly not wither away without it. They don't typically appreciate art or beautiful crafts, and are much less sensitive to color and architectural form. They are rarely collectors and, if they are, are generally not passionate about it. They are much less imaginative, much more rarely daydream and reflect much less often than average. If they enjoy music or other art forms, they stick to what is conventional and popular, and rarely enjoy more than one genre. They are much less often musical or artistic themselves (both of these are rare in the general population). They rarely become immersed in a book, or a movie, or in their own thoughts.

They tend to be stable and conventional (particularly if they are also average or above in conscientiousness). At least moderate levels of creativity tend to be necessary for entrepreneurial success, and prove comparatively useful at the top of hierarchies, even in very conservative occupations such as banking, accounting and law, which need creative people in leadership positions to provide new vision and direction.

Liberals are higher in aesthetics than conservatives (although the biggest difference between the two is openness at the trait level).

Women are higher in aesthetics than men. The mean percentile for women in a general population (women and men) is 56.5. For men it is 44.5.
